

Accident Data Analysis

Key Findings:

After analyzing the data of Accidents, we came to the conclusion that the total number of **accidents** occurred was around **60,000** in the year 2018 and that the total number of **casualties** were around **79,000**. Most of the accidents were severe like fatal with severity level of 3. **Around 51.98K people suffered severe injuries which were fatal.** The total number of vehicles that appeared in the accidents were around 110K. Talking about the number of casualties by month, from January to December the casualties were more than 5000 in each month.

Now let's talk about number of accidents by week, **most accidents** occurred on 6th day i.e. **Friday**. Okay so from this we can conclude that most of the accidents occur on Friday because in most of the offices and workplaces, Saturday and Sunday are considered as holiday, so people may drink and drive on Fridays a lot or like in a hurry to reach somewhere to spend their weekend.

As we can also see that the **least number of accidents** occurred on the 1st day of the week, i.e., **Sunday**. This is because people are mostly in their house spending time with family and less on roads.

Talking about accidents by month, we can see that **most of the accidents** occur in the month of **May, June and November**. It may be because most of the holidays occur in these months only. **Least accidents** occur during the months of **August and September**. Average speed limit is around 35km/hr.

Recommendations:

So, after analyzing the data we can recommend that people should take care of all the rules on Friday night. Rules should be more strict in the months of June, July and November to reduce the number of casualties. People should maintain the average speed of 35 km/hr and less.
